Introduction:

SAP Testing Center

SAP solution testing is no longer just a technical step. It is now a critical factor for ensuring operational continuity, successful innovation adoption, and project success.

The **SAP Testing Center (STC)** by **Inetum** is a specialized unit that combines **automation, data intelligence, and agile** methodology to revolutionize how companies test in SAP and non-SAP environments.

Our goal is to ensure updates, integrations, and projects are delivered with **minimal risk, maximum value, and full alignment with business needs.**

Why Strategic and Automated Testing Matters

The complexity of SAP systems and the frequency of updates require a testing model that goes beyond traditional practices. Strategic and automated testing provides significant benefits, such as:

- › Fewer production defects
- › Reduced rework and defect costs
- › Greater confidence in project deliveries
- › Faster upgrade and innovation cycles

By automating and standardizing testing, Inetum helps clients accelerate response times, ensure traceability, and maintain quality across all phases of the SAP lifecycle.

Traditional testing approaches struggle to keep up with the demands of modern SAP environments. With continuous delivery, frequent updates, and complex integrations, manual

and unstructured testing is no longer viable. This exposes companies to risks such as production failures, deployment delays, and increased operational costs.

Adopting a strategic and automated testing model enables:

- › Early detection of critical issues before go-live.
- › Continuous quality assurance during sprints and releases.
- › Standardized processes that enhance compliance and governance.
- › Better resource utilization and stakeholder confidence.

STC Service Offering

The SAP Testing Center (STC) service portfolio is organized into three main areas, offering complete coverage for different testing needs:

Continuous Support

Provision of an on-demand testing team focused on operational efficiency and cost reduction.

Testing Services

Comprehensive coverage of the entire testing lifecycle, including functional, integration, regression, end-to-end, and UAT testing.

Projects and Enhancements

Full support for complex initiatives such as migrations, rollouts, upgrades, and digital transformation projects.

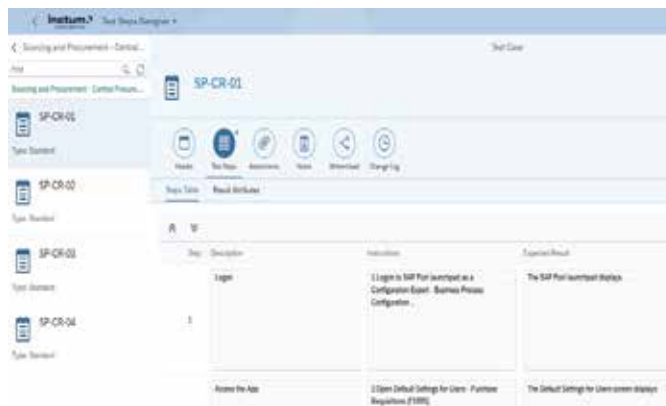

Basic process SAP Testing Center

STC InSight: Usage-Based Intelligence and Planning

SAP S/4HANA
& ECC

Accelerate Your SAP Project with STC InSight, an intelligent accelerator that uses real system usage data to guide testing decisions with precision.

Based on metadata extracted directly from the client's SAP environment, STC InSight enables:

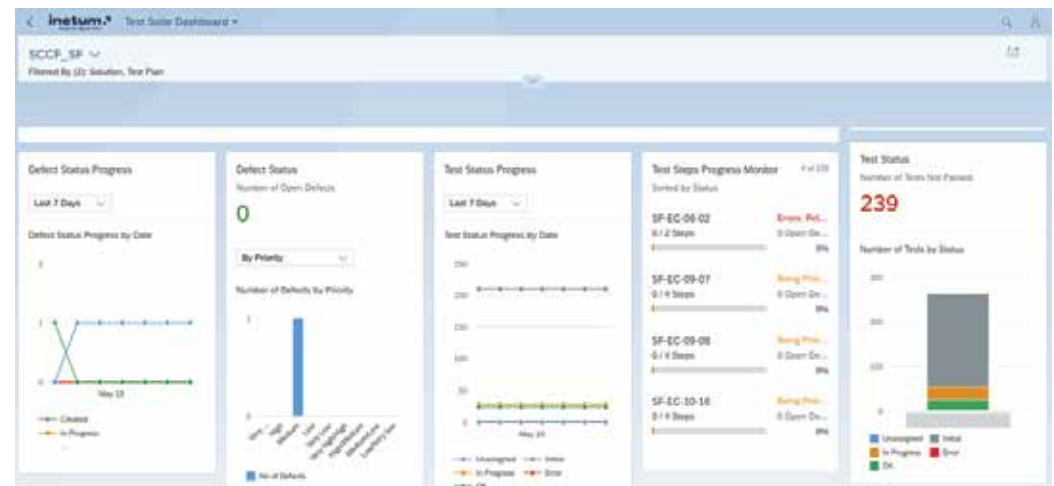

- › Accurate identification of the required test scope
- › Script suggestions based on best practices aligned with SAP Signavio
- › Structured effort estimations and test plans

This approach ensures focus on the most critical processes, assertive prioritization, and greater efficiency in test execution.

Inetum Testing Platform: Visibility, Audit and Collaboration

Inetum's proprietary testing platform adds a new dimension to test management by combining technology, usability, and traceability in a single integrated environment. Key features include:

- ▶ Centralized testing dashboard providing full visibility into progress and quality
- ▶ Fiori-based UAT interface, intuitive and aligned with the SAP user experience
- ▶ Automatic generation of test step evidence, ensuring traceability and compliance
- ▶ Real-time defect tracking with integrated performance indicators (KPIs)
- ▶ Audit-ready reports, eliminating the need for manual spreadsheets

SAP Cloud ALM for testing in S/4HANA

For SAP S/4HANA projects, especially in the Public Cloud version, the STC leverages SAP Cloud ALM to deliver a modern, integrated, and efficient testing approach.

Key benefits include:

- › Native integration with SAP Cloud ALM, with no additional costs
- › Over 400 ready-to-use scripts covering key scope items
- › Unified dashboard for manual and automated tests, providing centralized visibility
- › Full traceability with a significant reduction in defect rates

In addition, by using the Intelligent Test Scoper, regression test scope is optimized based on the actual impact of changes. This ensures faster, safer deliveries aligned with business priorities.

SAP Test Automation: Efficiency and Coverage

Automation is key to modern SAP projects. STC uses tools like Tricentis Tosca, CBTA, Panaya, S/4Hana Clou test automation and more, with a data-driven and business-priority approach.

The automation process follows well-defined steps:

01. Identification of critical processes
02. Definition of the automation scope
03. Development of test scripts
04. Continuous execution and validation
05. Ongoing adaptability maintenance

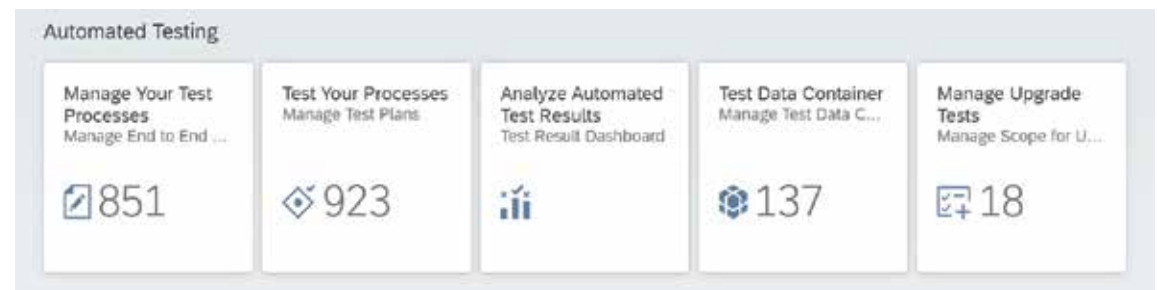

This approach is applied to regular testing cycles such as regression, PUT, and UAT, ensuring broad coverage and a significant reduction in manual effort.

TEST AUTOMATION

Ready to Transform Your SAP Testing?

With the SAP Testing Center, you have everything you need to turn testing into a true competitive advantage.

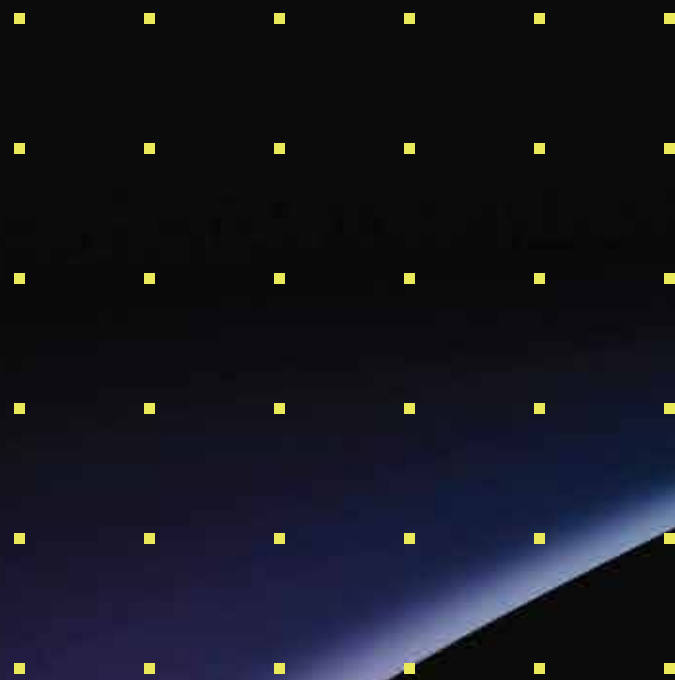

- › Intelligence based on real system usage
- › Integrated management and automation platform
- › Agile methodology, proven in real-world projects

Fewer defects. Lower costs. Faster deliveries.

Shall we take the first step?
